ABSTRACT

Methods and Systems for training a user regarding controlling a device. Through these methods and systems a user may remotely access a device in order to perform an assignment or task designed to train the user in the operation of the device. The user is able to access the devices through a user computer that is remotely connected to a pod controller. This connection may traverse a Internet or Intra-net, or it may be a direct connection. The pod controller receives device control information sent from the user and translates it so it can be directly fed into the device, thus, providing the user with actual control over the device.
